

Afinion Project-Viewer 3.0

Why Make Use of Time Reporting?

1. Time reporting with the Afinion Project-Viewer does not modify your plan data. Unlike other time reporting software data is not directly written back into the planning and therefore does not modify the project plan.
2. Unlike Web Access or other time reporting applications time recording with the Afinion Project-Viewer doesn't need any installation nor extensive support. Time reporting with the Afinion Project-Viewer provides excellent value for money, since it hardly requires support and the license for time reporting is included in the license fee of the Afinion Project-Viewer, i.e. every licensed user also has a license for time reporting.
3. Time reporting can be used even in small companies without IT department, since it doesn't need any installation but can simply be extracted from the program archive to everybody's hard disk. Then save the database centrally on a server which is accessible to all users. Now the time reporting features can be used instantaneously.
4. Many companies and project managers do not need a highly complex time reporting. The comparison of planned and actual values as realised in the Afinion Project-Viewer is usually sufficient. Everything else is complex and error prone.
5. Afinion Project-Viewer is far cheaper than any other time reporting software on the market.
6. Time reporting with the Afinion Project-Viewer supports different modes of user permission. In particular there is a setting allowing every resource to report hours on an activity even if it hasn't been previously assigned to it. Since this setting is being directly controlled by the project manager, even a mixed setup is possible, since every project manager can decide independently whether to use this feature or not. Allowing every resource considerably reduces administration time and effort.
7. Time reporting with the Afinion Project-Viewer allows the project manager to estimate the degree of completion of each activity himself independent of the resources and to directly compare his estimate with the degree of completion calculated from the actual work hours reported by the individual resources.

8. Via the Afinion SAP interface the data could also be transferred to CATS or other ERP systems. The work hours together with the costs (from SAP PS or SAP CO) can then be integrated into Microsoft Project. If you would like to learn more on possible solutions please contact us at info@afinion.ch.
